Myles Scott

Plano, TX | (678) 301-9097 | mscott9160@outlook.com
linkedin.com/in/mylesbscott | github.com/mscott9160-web | myles-scott-portfolio.vercel.app

TECHNICAL SKILLS

Languages: Java, Python, TypeScript, SQL, JavaScript
Frameworks & Libraries: Spring Boot, FastAPI, React.js, Node.js, React Native
Data: PostgreSQL, Oracle, JDBC, Apache Kafka
Cloud & DevOps: Oracle Cloud, Docker, OpenShift, Gloo Gateway
AI/ML: LLM integration, MCP, open-source model evaluation, multi-agent frameworks
Tools: JUnit, Pytest, Playwright, Vitest, Postman, Git, Kibana

PROFESSIONAL EXPERIENCE

USAA | Financial Accounting, Accounting & Investments | Plano, TX
Software Engineer III | Jan 2025 – Present
Software Engineering Intern | May 2024 – Aug 2024

- Lead backend development on the Accounting Report Modernization (ARM) platform that replaced USAA's legacy batch accounting with a real-time, event-driven architecture; hired as the team's first API engineer and established API development standards for a group with no prior API experience
- Built bidirectional financial APIs between partner systems and Oracle Cloud GL as the system of record, enforcing COBIT compliance controls and generating audit-ready payloads, with Apache Kafka handling bulk payload processing and real-time posting status to downstream systems
- Migrated legacy batch jobs to real-time Spring Boot services, reducing recurring job failures and moving accounting data from scheduled batch cycles to near real-time posting
- Built a self-service onboarding platform (React + Spring Boot) for registering new GL source systems across dev, test, and prod, replacing manual SQL inserts and PM-mediated requirements gathering with a self-service workflow owned by the source teams
- Established the CI/CD pipeline with automated unit, integration, and performance testing (JUnit, Postman, JMeter) and Gloo gateway deployments
- Partner with the internal ML platform team to integrate open-source LLMs into runtime accounting services and CI/CD pipelines; built a read-only MCP server over the GL GET APIs giving LLM tooling scoped query access with no write path to the ledger, now under AI governance review for production
- Created and maintain Corporate Technology's internal AI tooling repository, the central distribution point for agent frameworks, prompt libraries, skills, and reference material used across the organization
- Co-founded the AI Center of Excellence for Accounting & Investments with senior leadership and lead a bi-weekly AI Champions series (11 developers); run office hours, PoC presentations, and enablement for teams starting AI adoption
- Designed a multi-agent development framework in VS Code modeling a full scrum team across architecture, front-end, back-end, QA, security review, documentation, and Jira workflow; published org-wide and presented to business partners, product owners, and senior leadership
- (Intern) Integrated Oracle Fusion Cloud ERP via REST and SOAP to automate accounting period and journal batch validation, reducing interface failures in the enterprise general ledger

EDUCATION

University of Texas at Dallas — **Richardson, TX**
Master of Science in Financial Technology & Analytics — Expected December 2027

Embry-Riddle Aeronautical University — **Daytona Beach, FL**
Bachelor of Science in Software Engineering, Minor in Business Administration — Graduated December 2024

PROJECT EXPERIENCE

Arbiter | Java 21, Spring Boot, FastAPI, PostgreSQL, Redis | github.com/mscott9160-web/arbiter

- Developing a Java 21 Spring Boot gateway that classifies inference requests, selects a model tier, and writes an auditable per-request cost ledger, with a Python FastAPI classifier sidecar behind a versioned HTTP contract
- Implemented fail-closed cost calculation in BigDecimal that rejects unpriced models rather than defaulting to zero, plus tenant-scoped caching and a semantic-cache deny-list with auditable reasons

Achlens | Python, MCP, pytest, uv | github.com/mscott9160-web/achlens

- Built a local-first MCP server and CLI that parses fixed-width ACH files, validates structure and control totals, and reports which field failed rather than raising an exception
- Masked account and identification fields by default, gated reveal behind an operator flag, and disabled filesystem access unless an allowed root is configured; 194 tests and eight architecture decision records

Cash Flow Simulator | Python, FastAPI, React, TypeScript, PostgreSQL | github.com/mscott9160-web/cash-flow-simulator

- Built a 90-day daily balance projection engine modeling biweekly vs. semi-monthly pay cycles and business-day settlement shifts across weekends and US federal holidays, isolated as a pure domain core with no framework or database dependencies
- Implemented a constrained optimizer that identifies negative-balance days and returns a single explainable schedule change, searching only obligations classified as movable
- Exposed the engine through a versioned FastAPI contract consumed by both React and Expo clients, keeping financial rules from being reimplemented per platform; 44 backend tests plus Playwright end-to-end coverage
